

TAPROOT F₂OTM

OSMOTIC FILTRATION SYSTEM

Product Code: TF

at home in nature

Why do FTS osmotic water filters perform so well in nature? Because they *come* from nature. Made from plant-derived cellulose, the Taproot's membrane filter is tough, loves water, and is virtually clog-proof. This means it works every time, no matter how bad the water source.

More importantly, its amazing 0.0003 micron pore size assures safety and peace of mind when you need to drink from a compromised water source.

The Taproot system is comprised of two 20L water cans. Fill one can with dirty water, attach the syrup pouch that drives the osmotic filtration process ... and that's it! Clean drink will automatically flow into the collection can -- no pumping or power source required.

The Taproot's 35 L/day output is perfect for small groups or families in disaster or recreational settings.

Reliable hands-free filtration and a great tasting drink that will energize you with calories and electrolytes.

volume: 20L

filtration production: 35L/day

filter life: 90 days

purity: 6-log bacteria reduction

turbidity high clog resistance

dual-reservoir design
